

ABSTRACT

A gaming machine for conducting a wagering game includes a visual display and a panel. The panel is positioned in front of the display and reveals at least a portion of the display. The machine may include other externally visible devices for facilitating play of the gaming machine. Such devices may, for example, include a bill
5 validator, a coin acceptor, a printer, a card reader, a card reader display, and/or a secondary display. Respective bezels may encompass the panel and such other devices. The panel and the bezels are coated or impregnated with a conductive material to provide shielding from electromagnetic interference.
